---

distances. It is based on the 2.4 GHz ISM band. Bluetooth is used in many types of mobile devices and computers to connect wirelessly to each other and to peripheral devices. It allows the mobile phone to connect wirelessly to devices such as printers, computers, headsets and keyboards for hands-free operation. Bluetooth technology is evolving rapidly to support new applications, such as wireless LAN, remote computer access, telemetry, smart toys and radio-controlled car racing. There are two versions of Bluetooth: Bluetooth 2.0 and Bluetooth 1.2. Bluetooth 2.0 offers faster data transfer speeds. Bluetooth 1.2 offers lower power consumption and longer operating life. VHF: 88.1-88.3 MHz C Band: 174.2-174.7 MHz UHF: 435.95-436.15 MHz 16 VHF High Frequency The high frequency (HF) radio is a type of radio that operates at radio frequencies from 30 megahertz (MHz) to 3 gigahertz (GHz) and can reach distances of thousands of miles. Although HF radio uses a lot of power, it is useful for communication over long distances at a great deal of power. HF can transmit from one continent to another and almost always go through the air. C HF UHF High Frequency (HF) The high frequency (HF) radio is a type of radio that operates at radio frequencies from 30 megahertz (MHz) to 3 gigahertz f3e1b3768c
